A first course in String theory (Zwiebach) [7]: an interesting and different approach, making little use of conformal field theory methods, in favor of a less formal approach. Basic Concepts of String Theory (Blumenhagen, Lust, Theisen) [8]. As its name does not suggest, this book covers a lot of rather advanced topics about the worldsheet aspects of string theory. It is also rather appropriate for a math-oriented reader.

This section provides lecture notes for the course. These lecture notes were prepared in LaTeX by Bryan Owens, an MIT student. He used handwritten notes taken in class by Kayla Jacobs, an MIT graduate, in producing them. Professor Zwiebach has not thoroughly proofread these notes but believes they will be useful to people that want to know what goes on during lecture and what material gets ...

In this set of lectures Professor Susskind gives an introduction to String Theory, which he describes as a mathematical framework for theories that unify all the forces of nature, including gravity. In string theory, fundamental objects are no longer point particles; instead they are strings or higher dimensional objects called D-branes.
